

LinkedIn posts from The state of B2B monetization in 2025

B2B Monetization: <https://www.growthunhinged.com/p/2025-state-of-b2b-monetization>

Product Hunt: <https://www.producthunt.com/shoutouts>

Post 1: The Death of Seat-Based Pricing?

Seat-based pricing is dying, and fast.

Over the last 12 months:

- Flat-rate pricing fell from 29% → 22%
- Seat-based pricing dropped from 21% → 15%
- Hybrid pricing soared from 27% → 41%

Why?

AI changes everything.

Agents replace people. Efficiency replaces headcount.

And your old pricing model? It doesn't reflect this shift.

Still charging per seat in 2025?

It's time to evolve, or risk falling behind.

Who's moving on?

[Figma](#) offers platform-scale pricing beyond seats

[Descript](#) bills by transcription and AI usage

[Amplitude](#) emphasizes usage-based plans for events, not humans

Are you still pricing per seat? Why?

Post 2: Hybrid Pricing is Eating the World

[Clay](#), [Monday.com](#), [Salesforce](#), [Atlassian](#)

What do they have in common?

Hybrid pricing.

Clay's model:

- Unlimited seats
- Usage-based credits
- 10% annual discount + credit rollover

It's elegant. Scalable. And here to stay.

Hybrid pricing jumped to 41% adoption in 2025.

More models?

[Retool](#) = platform fee + deployed usage

[Mixpanel](#) = tiered usage + user seats

What's your hybrid pricing strategy?

Post 3: AI is Breaking Your Pricing Model

AI doesn't log in.

It doesn't buy seats.

It delivers work.

If you're still charging per user in 2025...

You're probably pricing wrong.

Examples:

- [Cursor](#): \$200M ARR with ~60 people = ~\$3M per employee
 - [Lovable](#): \$10M ARR in 60 days with under 20 people
 - [Klarna](#): Boosted ARR/employee from \$575K → \$1M
 - [Alphabet](#) / [Google](#): 30% of the code is AI-generated
 - [Microsoft](#): 95% of code predicted to be AI-generated by 2030
- How are you pricing your AI features?

Post 4: Outcome-Based Pricing = The Holy Grail

Only 5% of SaaS companies price based on outcomes.

But 25% say they'll get there by 2028.

Why is it so hard?

You need CAMP:

- Consistency
- Attribution
- Measurability
- Predictability

Who's doing it now?

- [AirHelp](#) — 35% success fee

- [Chargeflow](#) — % of chargebacks recovered
- [EvenUp](#) — a legal AI startup monetizing per case outcome
- [Flycode](#) — pay when dev bottlenecks are resolved

Could you adopt outcome-based pricing today?

Post 5: Pick Your Hybrid Pricing Flavor

Hybrid pricing = more than just “subscription + usage.”

There are **7 core structures**:

1. PAYG — e.g., [OpenAI](#)
→ Pay as you go based on tokens, API calls, or feature usage
2. PAYG with cap — [Postmark](#)
→ Usage billing with monthly maximums to manage spend
3. Usage tiers — [Snyk](#), [Zapier](#)
→ Tiered thresholds based on the volume of use, such as API calls or tests
4. Platform fee + usage — [Retool](#)
→ Base platform license + added cost based on deployment
5. Platform + included usage + overages — [Notion](#)
→ Bundled plans with limits, followed by overage billing (esp. for AI features)
6. Adaptive flat rate — [Copy.ai](#)
→ Flexible plans that evolve based on team size and needs
7. Platform fee + success bonus — [AssemblyAI](#)
→ Core platform pricing + value-based add-ons based on usage or accuracy

Each one has trade-offs. Each one needs thoughtful implementation.

Which hybrid structure are you testing?

Post 6: The Transparency Illusion

Everyone says, “Show your pricing.”
But that’s not what’s happening.

Companies with >\$5K ACV?
→ Rarely publish pricing

PLG companies?
→ Usually do

AI startups?

→ Pricing is too new, complex, and volatile

Real examples:

→ [Linear](#) shows pricing clearly

→ [Anthropic](#), [OpenAI](#), [Runway](#) don't

→ Usage, credits, and seatless models = confusion

Buyers don't want numbers.

They want clarity.

Do you publish your pricing? Why or why not?

Post 7: Who Owns Pricing?

Early stage = Founder

Later stage = Hot potato

Sales → Product → Finance → RevOps → 🧑‍💻

This chaos peaks around \$5–20M ARR.

Stats:

→ 75% of SaaS companies changed pricing in the last year

→ Few have dedicated pricing leads

→ Most rely on spreadsheets + gut

Real Talk: Who Owns Pricing?

- [Jasper](#) → started founder-led, now handled by the growth team
- [Ramp](#) → runs a dedicated monetization squad with cross-functional input
- [Amplitude](#) → conducts quarterly product-pricing reviews across product + GTM

Who owns pricing in your org?

Post 8: From Software → Outcomes

The Monetization Timeline:

1. On-Prem → Own it

○ Example: [Oracle](#)

Traditional software licensing with on-premises deployment.

2. SaaS → Rent it

- Example: [HubSpot](#)
Subscription-based access to cloud-hosted software.
- 3. Usage-Based → Pay as you use
 - Examples:
 - [Snowflake](#)
 - [Twilio](#)
Billing is based on actual usage metrics, such as data processed or API calls.
- 4. Outcome-Based → Pay for results
 - Examples:
 - [EvenUp](#)
 - [Chargeflow](#)
Pricing is tied directly to the achievement of specific outcomes, like successful case resolutions or recovered chargebacks.

Each shift moves the risk from buyer → vendor.

Each shift demands new pricing infrastructure and muscle

This isn't just product evolution.

It's a business model evolution.

What pricing shift are you planning for next?
